

QA SCAN Electronic Verifier

NEED A WAY TO ASSURE YOUR PRODUCT HAS A TAG OR LABEL ON IT?

The Q.A.-Scan is a device designed to assure your product receives a label or tag after the automated application is performed.

How it works:

The Q.A.-Scan comes with a product sensor, signal light, digital strobe camera, and a logic box which is affixed to your production line. If the Q.A-Scan does not see a label or tag on your product, it provides a signal (dry contact) which will trip an E-stop, or activate a gate. The gate can remove the product from the other items when the relay is triggered. After the trigger is sent, it either can automatically reset to ready mode, or have a user manually reset the system if needed.

This Q.A.-System requires either our PDF Plus+ or custom designed software to work properly. Added data collection features, such as LOT Tracking and Product Count collection is available upon request and quoted per project.

The Q.A.scanner can be affixed in several places after the tag or label is applied, but is normally right after the application device. Close detection allows you time to perform reaction tasks such as stopping the line, or auto reject. Low light and dusty environments are not an issue for the device, and is a 7/24 rated device.

This device can be upgraded to become a Track-it device at a later time, should you want to collect and/or track your product data in batch or real time data. Ask us more about this, we are here to help.
